This completely revised and enlarged second edition provides an up-to-date overview of all major topics in sedimentary geology. It is unique in its quantitative approach to denudation-accumulation systems and basin fillings, including dynamic aspects. The relationship between tectonism and basin evolution as well as the concepts of sequence cycle and event stratigraphy in various depositional environments are extensively discussed. Numerous, often composite figures, a well-structured text, brief summaries in boxes, and several examples from all continents make the book an invaluable source of information for students, researchers and professors in academia as well as for professionals in the oil industry.

In Geontologies Elizabeth A. Povinelli continues her project of mapping the current conditions of late liberalism by offering a bold retheorization of power. Finding Foucauldian biopolitics unable to adequately reveal contemporary mechanisms of power and governance, Povinelli describes a mode of power she calls geontopower, which operates through the regulation of the distinction between Life and Nonlife and the figures of the Desert, the Animist, and the Virus. Geontologies examines this formation of power from the perspective of

Indigenous Australian maneuvers against the settler state. And it probes how our contemporary critical languages—anthropogenic climate change, plasticity, new materialism, antinormativity—often unwittingly transform their struggles against geontopower into a deeper entwinement within it. A woman who became a river, a snakelike entity who spawns the fog, plesiosaurus fossils and vast networks of rock weirs: in asking how these different forms of existence refuse incorporation into the vocabularies of Western theory Povinelli provides a revelatory new way to understand a form of power long self-evident in certain regimes of settler late liberalism but now becoming visible much further beyond.

This extensively revised, restructured, and updated edition continues to present an engaging and comprehensive introduction to the subject, exploring the world's landforms from a broad systems perspective. It covers the basics of Earth surface forms and processes, while reflecting on the latest developments in the field. Fundamentals of Geomorphology begins with a consideration of the nature of geomorphology, process and form, history, and geomorphic systems, and moves on to discuss: structure: structural landforms associated with plate tectonics and those associated with volcanoes, impact craters, and folds, faults, and joints process and form: landforms resulting

from, or influenced by, the exogenic agencies of weathering, running water, flowing ice and meltwater, ground ice and frost, the wind, and the sea; landforms developed on limestone; and landscape evolution, a discussion of ancient landforms, including palaeosurfaces, stagnant landscape features, and evolutionary aspects of landscape change. This third edition has been fully updated to include a clearer initial explanation of the nature of geomorphology, of land surface process and form, and of land-surface change over different timescales. The text has been restructured to incorporate information on geomorphic materials and processes at more suitable points in the book. Finally, historical geomorphology has been integrated throughout the text to reflect the importance of history in all aspects of geomorphology. Fundamentals of Geomorphology provides a stimulating and innovative perspective on the key topics and debates within the field of geomorphology. Written in an accessible and lively manner, it includes guides to further reading, chapter summaries, and an extensive glossary of key terms. The book is also illustrated throughout with over 200 informative diagrams and attractive photographs, all in colour.
