Growing up to a massive 3 metres in length and 80 kilograms in weight, the Komodo dragon is the largest species of lizard in the world. Armed with more than 60 serrated teeth and an assortment of deadly oral bacteria, they are top predators. In the wild they feed upon buffalo, wild pigs and deer, consuming up to 80% of their own body weight in one meal, the equivalent of an average adult man eating around 64 pizzas in one sitting!

Komodo Dragon | Durrell Wildlife Conservation Trust

The Komodo dragon is the world's largest monitor lizard – just a few thousand survive today on a handful of islands east of Bali. Although a protected species on four islands in Komodo National Park, habitat encroachment by humans on the island of Flores threatens its future existence – numbers are dwindling as humans compete with the lizards for their prey (deer and pig). Dragons outside protected reserve areas are seen as a threat to livestock and are treated as pests rather than assets.

Conservation and population management of the Komodo ...

The Komodo dragon (*Varanus komodoensis*), also known as the Komodo monitor, is a species of lizard found in the Indonesian islands of Komodo, Rinca, Flores, and Gili Motang. A member of the monitor lizard family Varanidae , it is the largest extant species of lizard, growing to a maximum length of 3 metres (10 ft) in rare cases and weighing up to approximately 70 kilograms (150 lb).

Komodo dragon - Wikipedia

The dragon is a monitor lizard of the family Varanidae. It occurs on Komodo Island and a few neighbouring islands of the Lesser Sunda Islands of Indonesia. The popular interest in the lizard's large size and predatory habits has allowed this endangered species to become an ecotourist attraction, which has encouraged its protection.

The Komodo dragon, *Varanus komodoensis*, is the largest lizard endemic to five islands in southeast Indonesia. The islands of Komodo, Rinca, Nusa Kode and Gili Motang are part of Komodo National Park.

Komodo Survival Program - Komodo dragon

The Komodo dragon is an apex predator, with three ungulate species dominating the diet of adults: rusa deer (*Rusa timorensis*), feral pig (*Sus scrofa*) and water buffalo (*Bubalus bubalis*).

Life-History and Spatial Determinants of Somatic Growth ...

Adult Komodo dragons live mainly in tropical savannah forests. They prefer open lowland areas with tall grasses and bushes, but are also found in other habitats, such as beaches, ridge tops, and dry riverbeds. Young Komodo dragons are arboreal and live in forested regions until they are eight months old.
